

SYSTEM FOR EMBEDDING PROGRAMMING LANGUAGE CONTENT IN VOICEXML

Abstract of the Disclosure

A method for providing an interactive voice response service is provided. The method uses a VoiceXML interpreter in cooperation with a voice/audio application. The voice/audio application uses scripts coded in VoiceXML with embedded Java Server Pages (JSP). The use of VoiceXML along with JSP allows the present invention to provide an implementation that minimizes interaction between the voice/audio application and the VoiceXML server.
